ABSTRACT:

Variation of ink droplet velocity and droplet mass in thermal ink-jet print heads having at least (one primary heater element) is achieved by means of a circuit for generating time-shifted heating pulses.

The heater element structure is such that there is at least (one secondary heater element) in addition to and physically separated from each primary heater element. The circuit for generating time-shifted heating pulses for the primary and secondary heater elements applies those pulses in

such a way that a vapor
bubble ~~has already~~ formed in the printing fluid on
the secondary heater element
at the point at which a vapor bubble starts to form
in the printing fluid on
the primary heater element.

5 Claims, 11 Drawing figures

Exemplary Claim Number: 1

Number of Drawing Sheets: 5

----- KWIC -----

Claims Text - CLTX (18):

(i) providing a first heating energy pulse to
said primary heater element
during a first time period;

Claims Text - CLTX (19):

(ii) providing a second heating energy pulse to
said damper bubble heater
elements during a second time period commencing a
predetermined time prior to
the beginning of said first period to control drop
ejection velocity; and
